/lab host="E. coli strain XL10-Gold, T1-resistant, F-"
/clone_lib="Mouse 10kb plasmid UUGC2M library"
/note=="Vector: PWD42nv; Purified genomic DNA from M
musculus C57BL/6J (female) was obtained from the Jackson
Laboratory Mouse DNA Resource
(http://www.jax.org/resources/documents/dnares/). The DNA
was bydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil #722114|gp|ART29072.1); a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
adaptored vector DNA, and transformed into
chemically-competent E. coll XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
(TIGR). The BAC library was generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from microcorganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas AgM Universty BAC Center
University. College Station, Texas 77843-2123, USA using a HindIII
Seq primer: M13 Por
Class: BAC ends.

This clone is from an A. gambiae BAC library (ND-TAM) provided by
F.H. Collins and sequenced by The Institute for Genomic Research
F.H. Collins and sequenced by The Institute for Genomic Research
NNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from mirrorganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas A&M Universty BAC Center
University, College Station, Texas 77843-2123, USA using a HindIII
partial digest.
Seq primer: M13 For
Class: BAC ends.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          602 bp DNA linear GSS 27-JUN-2003

The invention relates to human breast specific nucleic acids (I) comprising: (a) a sequence encoding any one of 95 protein sequences (ABP666708); (b) any one of 115 polymodeotide sequences (C ABP8356-ABP83672); (c) a molecule that selectively hybridizes to (a) or (b); (d) a molecule having at least 60% sequence identity to (a) or (b). (The breast specific nucleic acid molecules, polypeptides and antibodies or are useful for identifying, diagnosing, monitoring, staging, imaging and treating breast cancer and non-cancerous disease states in breast tissue. Or they are also useful for producing transgenic animals and cells and producing engineered breast tissue for treatment and research. The transgenic animals are useful as animal model systems used in elaborating the biological function of the polypeptides, studying conditions and/or disorders associated with aberrant expression and in screening for compounds effective in ameliorating the conditions. The polymucleotides
treating breast cancer and non-cancerous disease states in breast tissue.

AAC7446 to AAC77606 encode the proteins given in ABB40237 to AAB43397, which represent the human ORFX open reading frames 1 to 3161. The ORFX sequences have activities such as: cytostatic; hepatotropic; vulnerary; antipactiatic; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiparkinsonian; nootropic; neuroprotective; osteopathic; anticonvulsant; antiparkinsonian; nootropic; antidiabetic; hypotensive; deradiant; thrombolytic; coagulant; vsottopic; antidiabetic; hypotensive; antiviral; immunosuppressive; antiniflammatory; antibacterial; antiviral; antifungal; antirheumatic; antihinflammatory; antibacterial; acquences can be used for determining the presence of or predisposition to, or preventing or treating pathological conditions associated with an ORFX-associated disorder. The nucleic acids can be used to express ORFX

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        41 ArgValGlyAspGlnIleLeuArgValAsnAspLysSerLeuAlaArgValThrHisAla
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel human secretory or membrane proteins (ADAS4072-ADAS5710) and their coding sequences (ADAS4041). The coding sequences are useful in the gene therapy of diseases caused by abormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 551 G; 287 T; 0 U; 0 Other;

The protein encoded by the nucleic acid of the invention is useful for treating central and peripheral nervous system diseases (e.g. peripheral neuropathy, Huntington's disease, amyotrophic

lateral sclerosis); neurodegenerative diseases (e.g. Parkinson's disease, Alzheimer's disease); autoimmune disease (e.g. systemic lupus erythematosus, rheumatoid arthritis, insulin-dependent diabetes mellitus); myeloid or lymphoid cell disorders (e.g. ansemia and thrombocytopaenia); myeloid or lymphoid cell disorders (e.g. osteoporosis, costeomical lateral and traumatic disorders (e.g. stroke, head traumal); lung or liver fibrosis; reperfusion injury in various tissues; bacterial, viral or fungal infections; allergic conditions such as cancer and tumours; and inflammatory diseases (e.g. septic shock, Crohn's cancer and tumours; and inflammatory diseases (e.g. septic shock, Crohn's care and tumours; and inflammatory diseases (e.g. septic shock, Crohn's confection of function may be used to inhibit the growth, viruses, or to effect bodily characteristics, biorhythms or circadian cycles of rhythms. The protein may also have for a soceria, fungi, viruses, or to effect bodily characteristics, biorhythms or circadian cycles of rhythms. The protein may also have function, differentiation, stem cell growth factor, haematopoiesis; regulation, immune stimulating or suppressing, chemotactic/chemokinetic, hemostatic and thrombolytic, receptor/ligand, and antiinflammatory activities. The cDNA sequences of the invention are useful for expressing recombinant protein for analysis. The present sequence is an expressed human cDNA sequence of the invention, this sequence is an expression cardument protein defined invention, this sequence is an expression

The invention is useful in developmental biology and in elucidaring cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLile176-ABL30511), expressed DNA abg72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences

The polymunosuppressive, conditions antianaemic activity. The polymunosuppressive, conditions of the invention can be used for gene therapy, conditions. These polypeptides or polymunostides are particularly useful for diagnosing, treating a variety of particularly useful for diagnosing, treating or preventing call particularly useful for diagnosing, treating or preventing call conditions, melanoma, melanoma, melanoma, mayeloma or sarcoma, anaemia, Crohn's disease, acquired immunodeficiency syndrome (MIDS), doodpasture's conditions, inflammation, osteoporosis, thombocytopaenia, psoriasis or hepatitis. ABX3440-ABX34835 encode the MDDT polypeptides represented in ABCHISO-MULI9845, described in the disclosure of the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          414
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          20 HisGlyValGlyIleTyrValSerLeuValGluProGlySerLeuAlaGluLysGluGly 39

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigaen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product with an agent that specifically product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions that invention provides nucleic and sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                             polypeptides - isolated products for the

interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and lung cancer

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contexting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination between the agent and the NAM or the expression product as a chetermination for the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, gastric cancer, prostate cancer and

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigon precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically biological sample isolated from a subject with an agent that specifically brinds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, remal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    417
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated cancer associated nucleic acids and polypeptides - isolated using sera from cancer patients, used to develop products for the diagnosis, monitoring or treatment of cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     39
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     59

The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a mucleic acid molecule (TAMM). The method comprises: (a) contexting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions of pharacterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast and cancer, colon cancer, gastric cancer, prostate cancer and

Complexes of selected interacting domains (SID) of polypeptides are useful in preventing and treating deafiness and other inner ear or hearing disorders and/or diseases in humans or animals. The methods are useful in screening drugs for agents which modulate protein interaction. The present sequence represents a DNA encoding the SID polypeptide that interacts with the human myosin VIIA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   4928 GTGGAGTACGGCCTGGGGATCTTTGTCACCGGCGTAGATAAGGACAGCGTGGCAGATCGA 4869
                                                                                                                                                                     The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidaes, therapeuticing and pharmaceutical frugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins (ABB57737-BPINGOR). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      175
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SerGlyLeuLysValGlyAspGlnIleLeuGluValAsnGlyArgSerPheLeuAsnIle 195

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from brosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticidates, therapeutics and pharmaceutical furuge. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABL3070). The sequence data for this parent did not form part of the princed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        91 IleTyrThrTrpValAspProGlnGlyArgSerIleSerProProSerGlyLeuProGln 110
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ProHisGlyGlyAlaLeuArgGlnGlnGluGlyAspArgArgSerThrLeuHisLeuLeu 130
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        31 ProGlySerLeuAlaGluLysGluGlyLeuArgValGlyAspGlnIleLeuArgValAsn 50

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to genes that modify beta-catenin pathway and to the identification of human MBCAT (modifiers of beta-catenin) genes. The MBCAT polypeptides are therapeutic targets for disorders associated with beta-catenin function and are useful for manufacturing a medicament for diagnosing or treating breast, colon, lung or ovary cancer. The present sequence represents a human MBCAT polypeptide encoding DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying a candidate beta-catenin pathway modulating agent for diagnosing or treating cancer by detecting a test agent-blased activity of the assay system comprising a purified MBCAT polypeptide or nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ďŝ

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                 US-10-078-090-151

The library was characterised by oligonucleotide fingerprinting
(ONF) to reduce sequencing redundancy. According to the ONF

ONF to reduce studied state of the Same hybridiaation matrix with a partery of 200 8mer oligonucleotides are grouped into clusters. One clone per ONF cluster is salected for sequencing. The size of each cluster is an indicator of the frequency of a transcript in the analysed library. The cluster size as well as the coordinates of the other clones assigned to the same ONF cluster as the clone from which the above EST is generated is available at the sea urchin project web site at: http://www.molgen.mpg.de/ag seaurchin/. cDNA clones and filters are distributed via the Resource Center/Primary Database of the German Human Genome Project (http://www.rzpd.de)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CD310081 643 bp mRNA linear EST 16-SEP-2003 StrPu691.003445 Sea urchin larva cDNA library MPMGp691 Strongylocentrotus purpuratus cDNA clone MPMGp691D1338;MPI_SURUDI_38D13 5', mRNA sequence.
